

## Results of the Virtual Academy of Genetics (VAoGEN) questionnaire on mosaicism in PGS

Ariel Weismann, Israel

Embryonic mosaicism has recently become the focus of growing attention and controversy in the context of PGS. In order to evaluate the extent of mosaic aneuploidy in clinical practice and to gain insights on the practices and views regarding this issue, we conducted a 20-item web-based questionnaire with questions related to mosaicism in PGS. A total of 102 IVF units from 32 countries performing 108,900 IVF cycles annually responded to the survey, representing both clinic which perform and those that do not perform PGS. The results of a web-based survey will be presented, emphasizing the ongoing debate and the urgent need for more robust data on PGS.
